Have your heating system cleaned and serviced, and checked for safe operation annually. You will need less fuel throughout the winter if your heating system is running safely and efficiently.

Find where the drafts of cold air are coming in and seal those places up! Your heating system will run less often and you will be more comfortable.

Replace old incandescent light bulbs with new energy efficient bulbs (like compact fluorescent or LED bulbs). LED bulbs can reduce your electricity costs for lighting by 75 percent or more!

Turn down your thermostat at night and when you will be away. Don't heat your home when you don't need to. Consider wearing a sweater when you are home.

Install insulation - even a little bit each year - to reduce heat loss from your home. Your goal, over time, should be to have a continuous "thermal barrier" all around your living space, to keep the heat in and the cold out.
